## 1 Ammonium Salt As An Additional Surrogate Stationary Phase

This is likewise one of the factors by obtaining the soft documents of this 1 ammonium salt as an additional surrogate stationary phase by online. You might not require more era to spend to go to the book launch as with ease as search for them. In some cases, you likewise complete not discover the pronouncement 1 ammonium salt as an additional surrogate stationary phase that you are looking for. It will unquestionably squander the time.

However below, bearing in mind you visit this web page, it will be fittingly definitely easy to acquire as capably as download lead 1

Ammonium salts of low molecular weight are soluble in water if the hydrocarbon portion of the amine is small. Because the nitrogen atom of an ammonium salt has a positive charge, ammonium salts are more water-soluble than amines. Drugs containing an amino group are often prepared as ammonium salts to improve their solubility in body fluids.

Ammonium salts are ionic compounds with the formula  $(R)_4N^+ + A^-$ , where R is hydrogen, alkyl or aryl groups and A is an anion. When R is alkyl or aryl then they are referred to as quaternary ammonium salts. The quaternary ammonium cations are permanently charged, independent of the pH of their solution. Most of the ammonium salts are soluble in water and strongly dissociated.

Most simple ammonium salts are very soluble in water. An exception is ammonium hexachloroplatinate, the formation of which was once used as a test for ammonium. The ammonium salts of nitrate and especially perchlorate are highly explosive, in these cases ammonium is the reducing agent. In an unusual process, ammonium ions form an amalgam.

Applications. Quaternary ammonium salts are used as disinfectants, surfactants, fabric softeners, and as antistatic agents (e.g. in shampoos ). In liquid fabric softeners, the chloride salts are often used. In dryer anticling strips, the sulfate salts are often used.

Quaternary ammonium salts (QAS) are cationic compounds containing alkyl groups in a chain length of C8 – C18, which are water soluble and can be used as disinfectants in textile industries. All of these compounds are membrane active agents and can damage cell walls of gram-positive bacteria.
