Aromatic side chain oxidation is an interesting reaction. Benzene is not easily oxidized, nor is an alkane. However, when attached to a benzene ring the benzylic carbon is susceptible to a unique oxidation yielding a benzoic acid. This video walks you through the reaction including what to look out for along with multiple practice problems.

Aromatic Compounds Examples. Aromatic hydrocarbon, are hydrocarbons containing sigma bonds and delocalized pi electrons between carbon atoms in a ring. For example, benzene. They are known as aromatic due to their pleasant smell. Aromatic compounds are broadly divided into two categories: benzenoids (one containing benzene ring) and non-benzenoids (those not containing a benzene ring) for ...

Huckel's rule states that an aromatic compound must have pi electrons in the overlapping p orbitals in order to be aromatic (n in this formula represents any integer). Only compounds with 2, 6, 10, 14, . . . pi electrons can be considered aromatic. Compound A has 6 pi electrons, compound B has 4, and compound C has 8.

**Identifying Aromatic Compounds - Organic Chemistry**

Aromatic compounds are ring structures with unusual stability due to delocalized pi electron density that is shared between all of the carbon atoms in the ring. There are a number of historically common names for aromatic structures. These names are frequently used in favor of standardized IUPAC nomenclature.
