Ultra-Wideband Power Amplifier Design Magnus Ståhl Power Amplifiers (PA) are large-signal amplifiers. This means that a large part of the load-line is used during signal operation. PAs are normally used as the last stage of communication electronics to provide large enough signals to be transmitted. This thesis describes the design of an ultra-wideband power amplifier.

two output ports. An UWB power divider based on overlapped butterfly open radial stub was proposed by Zhou et al. (2010a). The divider was designed by introducing one overlapped butterfly radial stub on each branch so that ultra-wideband performance was achievable. Delta stubs were incorporated in both WPD arms to achieve the UWB

A Low-Power, Linearized, Ultra-Wideband LNA Design Technique. Abstract: This work proposes a practical linearization technique for high-frequency wideband applications using an active nonlinear resistor, and analyzes its performance with Volterra series. The linearization technique is applied to an ultra-wideband (UWB) cascode common gate Low Noise Amplifier (CG-LNA), and two additional reference designs are implemented to evaluate the linearization technique - a standard (without ...

2. History of UWB antennas. In 1898, Oliver Lodge [1] firstly introduced the concept of UWB antenna design, such as spherical dipoles, square plate dipoles, triangular or " bow-tie " dipoles, and biconical dipoles. Fig.1 depicts Lodge ' s biconical antennas which are unmistakably used in transmit-recvie links.

In this article, a novel ultra-wideband power divider is presented. To achieve ultra-wideband performance and a sharp roll-off skirt, the parallel coupled lines and a short-circuited line are introduced on each side of the coupled three-line microstrip structure. Through even- and odd-mode analysis, the analytical design equations for this proposed power divider are obtained.
