Welcome to our textbook on scientific agent-based (or "individual-based") modeling of complex systems. The book is about designing models to solve specific problems of real systems, implementing models in Wilensky's NetLogo software (Wilensky, 1999), and analyzing models to develop theoretical understanding and predict system behaviors. Use the links above to learn about the book's objectives and content, download supporting materials, learn about the authors, get more information ...

Agent-Based and Individual-Based Modeling: A Practical ...

An agent-based model (ABM) is a class of computational models for simulating the actions and interactions of autonomous agents (both individual or collective entities such as organizations or groups) with a view to assessing their effects on the system as a whole. It combines elements of game theory, complex systems, emergence, computational sociology, multi-agent systems, and evolutionary ...

Individual-based models are also known as entity or agent based models, and as individual/entity/agent-based simulations. Some individual-based models are also spatially explicit meaning that the individuals are associated with a location in geometrical space. Some spatially explicit individual-based models also exhibit mobility, where the individuals can move around their environment. This would be a natural model, for example, of an animal in an ecological simulation.
