

Efficient And Adaptive Estimation For Semiparametric Models

Thank you categorically much for downloading **efficient and adaptive estimation for semiparametric models**. Most likely you have knowledge that, people have look numerous time for their favorite books with this efficient and adaptive estimation for semiparametric models, but stop in the works in harmful downloads.

Rather than enjoying a good book past a mug of coffee in the afternoon, otherwise they juggled like some harmful virus inside their computer. **efficient and adaptive estimation for semiparametric models** is comprehensible in our digital library an online access to it is set as public fittingly you can download it instantly. Our digital library saves in combination countries, allowing you to get the most less latency times to download any of our books past this one. Merely said, the efficient and adaptive estimation for semiparametric models is universally compatible as soon as any devices to read.

Finite-sample efficient estimators are extremely rare. In fact, it was proved that efficient estimation is possible only in an exponential family, and only for the natural parameters of that family. [citation needed] This notion of efficiency is sometimes restricted to the class of unbiased estimators. (Often it isn't.) Since there are no good ...

In this paper, we propose a class of “Efficient and Adaptive Semi-Supervised Estimators” (EASE) to improve estimation efficiency. The EASE are two-step estimators adaptive to model misspecification, leading to improved (optimal in some cases) efficiency under model misspecification, and equal (optimal) efficiency under a linear model.

indirect estimation schemes with polynomial approximation, e.g., [9]–[11], require heavy computational costs due to the use of time-dependent polynomials and the resetting mechanisms. These facts motivate us to develop a simple, efficient adaptive estimation framework to estimate time-varying parameters in D()t any observer and polynomial

This paper is concerned with estimating a conditional quantile function that is assumed to be partially linear. The paper develops a simple estimator of the parametric component of the conditional quantile. The semiparametric efficiency bound for the parametric component is derived, and two types of efficient estimators are considered.

Summary. Searching for an effective dimension reduction space is an important problem in regression, especially for high dimensional data. We propose an adaptive approach based on semiparametric models, which we call the (conditional) minimum average variance estimation (MAVE) method, within quite a general setting.

The proposed effort will further refine the adaptive model-based estimation and control guidance law developed during the Phase 1 effort to work in a two-tier algorithm with an agile, game-theoretic guidance law that is immune to the acceleration of the target.
