Elementary Differential Equations with Boundary Value Problems integrates the underlying theory, the solution procedures, and the numerical/computational aspects of differential equations in a seamless way. For example, whenever a new type of problem is introduced (such as first-order equations, higher-order equations, systems of differential equations, etc.) the text begins with the basic existence-uniqueness theory.

For example, if $y = Ce - kt$, then $y'(t) = -kCe - kt = -ky$. Therefore, we see that a solution of equation (3) is $Q(t) = Ce - kt$, (4) where C can be any constant. As in Example 1, the differential equation by itself does not completely specify the solution. But setting $t = 0$ in (4) leads to $Q(0) = C$.
