Empowering Knowledge Workers With Data. Organizations that rely solely on the IT department or analytics team to fulfil queries around analytics are likely to be dissatisfied with the results, says Alan Jacobson, the Chief Data and Analytics Officer (CDAO) at data science and analytics firm Alteryx. In an interview with CDOTrends, Jacobson cited a Harvard Business Review study which found that not a single organization that adopted such a model expressed satisfaction with the results.

Empowering Knowledge Workers describes the work of managers, decision makers, executives, doctors, lawyers, campaign managers, emergency responders, strategists, and many others who have to

think for a living. These are people who figure out what needs to be done, at the same time that they do it, and a new approach to support this kind of worker presents the logical starting point for understanding how to take advantage of ACM.

This work focuses on the creation of new knowledge, and how this has happened throughout all ages, as far back as the time of ancient philosophy to today. A product of integral research, it covers the process of creating new knowledge, leveraging existing knowledge, sometimes resulting in cutthroat innovations. It also includes knowledge systems such as conventional university systems to Mode 2 university concepts, culminating on integral research to innovation. This book will help the reader to realise that the subject of knowledge creation is no longer business as usual. Many innovations have been created for human benefit in general, but such innovations may have benefited only parts of society. The challenge in the world is that, while new innovations may be brilliant, there are sections of society who continue to slip into poverty. Modern innovators must also consider such communities and come up with appropriate interventions. This book will open the eyes of innovators to new possibilities. In addition, the subject of knowledge should not be an elitist affair. One may stand to gain a lot by seeing the knowledge in other people, whatever their station in life. This realisation can enable serious innovators to widen their scope in terms of the sources of existing knowledge which can be improved and reassessed as new knowledge. Such existing knowledge can be identified by engaging the very communities that may be affected by a problem or challenge. Such communities will have had time to interrogate their situations and think of possible solutions to such, though they might not have the economic capacity to implement such solutions. This is always a useful starting point if one is seeking a solution to a community problem. This book will be useful to students interested in the subject of knowledge and innovation, from under-graduate to PhD level. It will also benefit captains of industry, executives and managers who are interested in improving their knowledge improvement cycles in their companies.

"A dearth of strategy exists in the U.S. government. The volatile post-Cold War security environment drove the Department of Defense bureaucracies to adapt business processes and structures to cope with crises. The Global War on Terror and the emergence of diverse, insidious, and disparate threats to national security now dominate the focus of the Defense Intelligence Enterprise. Senior leaders and policy-makers laboring to keep abreast of the events of the day put current intelligence in high demand. Planners are likewise consumed with current operations and rarely engaged in planning beyond a five-year time horizon. Thus, there is little demand for long-term assessments or analysis, and few resources are dedicated to strategic estimates. The rapidly-changing character of the strategic environment demands greater effort to anticipate surprises and create strategies to address them. Achieving a strategy-minded workforce requires reorganization and better management to encourage creative thinking and innovation from knowledge workers, and a greater demand signal from leaders for strategically-oriented staff products. Without strategic vision and strategic foresight informed by well-developed strategic intelligence estimates, the United States and its military establishment will continue to lurch from daily crisis to daily crisis and continue to mistake near-term activity for long-term progress toward greater national security."--Abstract.

Highly predictable work is easy to support using traditional programming techniques, while unpredictable work cannot be accurately scripted in advance, and thus requires the involvement of the knowledge workers themselves. The core element of Adaptive Case Management (ACM) is the support for real-time decision-making by knowledge workers. How Knowledge Workers Get Things Done describes the work of managers, decision makers, executives, doctors, lawyers, campaign managers, emergency responders, strategist, and many others who have to think for a living. These are people who figure out what needs to be done, at the same time that they do it, and there is a new approach to support this presents the logical starting point for understanding how to take advantage of ACM. Keith Swenson points out, "We are seeing a fundamental shift in our workforce, and in the ways they need to be managed. Not only are companies engaging their customers in new ways, but managers are engaging workers in similarly transformed ways." In award-winning case studies covering industries as diverse as law enforcement, transportation, insurance, banking, state services, and healthcare, you will find instructive examples for how to transform your own organization. This important book follows the ground-breaking ACM publications, Taming the Unpredictable and Mastering the Unpredictable and provides important papers by thought-leaders in this field, together with practical examples, detailed ACM case studies and product reviews.

The complexities of employee empowerment have been largely underestimated and it is clear that organisations struggle with putting the concept into practice. Rozana Ahmad Huq recognises that effective utilisation of human resources is a strategic issue for organisations. Hierarchical organisations struggle to survive. The growing trend for downsizing and merging of organisations means that they can no longer maintain the 'command and control' approach and employees are given more responsibility and expected to take decisions. However, simply burdening employees with extra responsibility without empowering them does not deliver results. Drawing on her own research in organisations, Dr Huq investigates the concept of empowerment in a new way that combines themes from the disciplines of management and social work, the latter being a domain where empowerment is an important construct. This helps to bridge the gaps in knowledge in the management domain and draws attention to the positive and negative psychological implications for employees of the practice of empowerment that are often ignored by leaders and managers. Ultimately, the author offers a 'practice model' to help people in management and non-management understand the new roles and behaviours that they need to adopt if empowerment is to become a reality. This book is a resource for any business or other organisation genuinely interested in employee empowerment and for those with a responsibility for teaching about it.

Best Practices for Knowledge Workers describes ACM in the current era of digitization, Internet of Things (IoT), artificial intelligence (AI), intelligent BPMS and BPM Everywhere. You will learn how support of adaptive, data-driven processes empowers knowledge workers to know in real-time what is happening at the edge points, and to take actions through the combination of rule-driven guidance and their own know-how. It is not a traditionally-automated system but intelligent automation, where technology doesn't merely replace human decision-making but extends the reach of the knowledge worker; making IoT data actionable. As Sandy Kemsley points out in her foreword: As adaptive case management (ACM) systems mature, we are moving beyond simple systems that allow knowledge

workers to define ad hoc processes, to creating more intelligent systems that support and guide them. Knowledge workers still need to dynamically add information, define activities and collaborate with others in order to get their work done, but those are now just the table stakes in a world of big data and intelligent agents. To drive innovation and maintain operational efficiencies, we need to augment case work – typically seen as relying primarily on human intelligence – with machine intelligence. In other words, we need intelligent ACM. Highly predictable work is easy to support using traditional programming techniques, while unpredictable work cannot be accurately scripted in advance, and thus requires the involvement of the knowledge workers themselves. The core element of Adaptive Case Management (ACM) is the support for real-time decision-making by knowledge workers. In award-winning case studies covering industries as diverse as law enforcement, transportation, insurance, banking, state services, and healthcare, you will find instructive examples for how to transform your own organization. This important book follows these ground-breaking best-sellers on ACM; Thriving on Adaptability, Empowering Knowledge Workers, Taming the Unpredictable, How Knowledge Workers Get Things Done, and Mastering the Unpredictable and provides important papers by thought-leaders in this field, together with practical examples, detailed ACM case studies and product reviews.

Adaptive Case Management is ultimately about allowing knowledge workers to work the way that they want to work and to provide them with the tools and information they need to do so effectively. Surendra Reddy points out in his Foreword: "Imagine a fully integrated ACM system layered into the value stream of an enterprise. The customer support team is able to focus on customer needs, with easy access to the entire company's repertoire of knowledge, similar cases, information, and expertise, as if it were a service. To truly accommodate customers, companies must vest real power and authority in the people and systems that interact directly with customers, at the edge of the organization and beyond. ACM empowers the knowledge worker to collaborate, derive new insights, and fine tune the way of doing business by placing customers right in the center where they belong, to drive innovation and organizational efficiencies across the global enterprise. "It's a whole different thing; a new way of doing business that enables organizations to literally become one living-breathing entity via collaboration and adaptive data-driven biological-like operating systems. "ACM, in my opinion, is the future blueprint for the way of doing business." Thriving on Adaptability describes the work of managers, decision makers, executives, doctors, lawyers, campaign managers, emergency responders, strategists and many others who have to think for a living. These are people who figure out what needs to be done at the same time that they do it.
