It is also known as petrol direct-injection engine and it is a fuel injection employed in latest four-stroke gasoline engines. In this technology, the gasoline gets highly-pressurized and than injected via a common rail fuel line directly into the combustion chamber of each cylinder. This direct injecting fuel technology requires high-pressure injection into the combustion chamber, whereas low-pressure injection is used into the intake cylinder port.

Common rail direct fuel injection is a direct fuel injection system built around a high-pressure (over 2,000 bar or 200 MPa or 29,000 psi) fuel rail feeding solenoid valves, as opposed to a low-pressure fuel pump feeding unit injectors (or pump nozzles). High-pressure injection delivers power and fuel consumption benefits over earlier lower pressure fuel injection, [citation needed] by ...
