To introduce these properly, we would need to work with the category of modules, and introduce the notion of a derived functor. Unfortunately this is beyond the scope of the current course.

PROJECTIVE MODULES g.a. chicas reyes Abstract The present document is a survey of the basic properties of projective modules and some classical structure theorems due to Serre and Bass. In addition, a splitting property for projective modules recently established by Gabber, Liu and Lorenzini is also discussed. contents 1 Projective modules 2

STRUCTURE THEOREMS FOR PROJECTIVE MODULES  
The simplest example of a projective module is a free module. Over rings decomposable into a direct sum there always exist projective modules different from free ones. The coincidence of the class of projective modules and that of free modules has been proved for local rings [2] , and for rings of polynomials in several variables over a field (see [3] , [4] ).

Groups Trees And Projective Modules  
In mathematics, particularly in algebra, the class of projective modules enlarges the class of free modules over a ring, by keeping some of the main properties of free modules. Various equivalent characterizations of these modules appear below. Every free module is a projective module, but the converse fails to hold over some rings, such as Dedekind rings that are not principal ideal domains. However, every projective module is a free module if the ring is a principal ideal domain such as the in

The ' courtroom drama ' projective technique is often used by Mustard when using focus groups to conduct concept testing and creative development projects. Most often used towards the end of groups, respondents break into teams and are asked to use the preceding discussion and their own opinions to form a ' case for ' or ' case against ' the client preceding with one or more concepts or ...

projective modules is called an nth module of syzygies of M. Equivalently, an nth module of syzygies may be de ned recursively as a rst module of syzygies of any n 1st module of syzygies. Note that the (usually in nite) sequence ( ) ! P n!P n 1!! P 3!P 2!P 1!P 0!M!0 is exact as well, and so is a projective resolution of M.

Definition. A left module Q over the ring R is injective if it satisfies one (and therefore all) of the following equivalent conditions: . If Q is a submodule of some other left R-module M, then there exists another submodule K of M such that M is the internal direct sum of Q and K, i.e. Q + K = M and Q K = {0}.; Any short exact sequence 0 Q M K 0 of left R-modules splits.

In this talk, we will discuss exotic presentations for groups G with 4-periodic (group-)cohomology and their relation to the classification of projective ZG modules. This builds upon recent work of Mannan-Popiel on exotic presentations for the quaternion group Q(28).
