Histology Of Nervous Tissue

Chapter 6 - Nervous Tissue.

Nervous system is specialized for the rapid communication of information from one region of the body to another. Nervous system is divided anatomically into two major components: Central nervous system (CNS) – consists of the brain and spinal cord.

Peripheral nervous system (PNS) – peripheral nerves and ganglia.

Histology of Nervous Tissue

Flashcards | Quizlet

Peripheral nerves contain a considerable amount of connective tissue. The entire nerve is surrounded by a thick layer of dense connective tissue, the epineurium. Nerve fibres are frequently grouped into distinct bundles, fascicles, within the nerve. The layer of connective tissue surrounding the individual bundles is called perineurium. The perineurium is formed by several layers of flattened cells, which maintain the appropriate microenvironment for the nerve fibres surrounded by them.

Chapter 15 Review Sheet -
Histology of Nervous Tissue ...
Nervous or the nerve tissue is the main tissue of our nervous system. It monitors and regulates the functions of the body. Nervous tissue consists of two cells: nerve cells or neurons and glial cells, which helps transmit nerve impulses and also provides nutrients to neurons. Brain, Spinal Cord, and nerves are composed of nervous tissue, they are specialized for being stimulated to transmit stimulus from one to another part of the body rapidly.

It is the structural and functional unit of the nervous tissue that is specialized in excitability and conductivity. Each neuron is composed of cell body (perikaryon) and cell processes. They are located in the gray matter of the central nervous system, eye (rods and cones), ears (organ of Corti), olfactory mucosa, and ganglia.
