An optical integrated circuit (IC) is a compactly packaged electronic circuit, chip, or microchip that processes light directly to perform various communication functions. The advantages in using an optical integrated circuit include the higher maximum data speed that can be sent over an optical link as compared to

multiple photonic functions and as such is similar to an electronic integrated circuit. The major difference between the two is that a photonic integrated circuit provides functions for information signals imposed on optical wavelengths typically in the visible spectrum or near infrared 850 nm-1650 nm. The most commercially
