The paper helicopter is one of the devices to explain about design of experiments. The aim is to create the longest flying paper helicopter by means of experimental design. Paper helicopters are a nice example, because they are cheap to make, easy to test landing time and sufficient variables to make it non obvious.

Helicopters work based on changes in air pressure that result in lift. As the blades rotate it causes a pressure shift that results in build up of pressure under the blades and a decrease in pressure above that moves the air and the helicopter. You can see the example of lift using this toy.

We start by Tom dropping a helicopter made from blue paper. He drops it four times and we see that the results vary somewhat. This leads to a discussion of variation and to the introduction of the range and the standard deviation as measures of spread, and of the average as a measure of central tendency. Comparing Mean Flight Times

Teaching Engineers Experimental Design with a Paper Helicopter
To design an even better helicopter, we could repeat the entire DoE using even lighter paper and longer helicopter blades. A 50 cm wing may be bigger, but that does not mean it will be better. You may be able to predict the ideal settings based on a DoE result, but you should always be cautious when extrapolating beyond the data set, or the result may be a crashing helicopter.

The Paper Helicopter Experiment
Fly each helicopter 6 times, 3 holding it vertically (noise, N1) and 3 holding it at 45 degrees to vertical (noise N2) before releasing. This way, fly and collect times for 8x 6 = 48 flights. 8. Upon completion of all flights (48 tests), enter results on the right side of the L-8 array (input results in Qualitek-4 software). 9.
