Agriculture and Agronomy

Agronomy is a science that helps to feed the world. We can call the Agronomy as backbone of all agricultural sciences, because the management of soil and water, with a view to achieving the production potential of high yielding varieties, in green revolution, is exclusively an agronomic domain. It may

Agriculture or farming is the most important human economic activities. It differs from other industries in that it is a biological process : the primary products are organic and the resource base is the physical environment of land, water and air. One of the principal aims of agriculture is to channel as much as possible of the energy from incoming solar radiation into selected crops and/or livestock through efficient management practices and to minimise that used by such potential competitors as weeds and

pests. The physical resource base determines the range of use to which land can be most economically put to agriculture at a particular time and natural variability of the physical environment makes agriculture one of the most unpredictable human activities.

This textbook explains the various aspects of sustainable agricultures to undergraduate and graduate students. The book first quantifies the components of the crop energy balance, i.e. the partitioning of net radiation, and their effect

on the thermal environment of the canopy. The soil water balance and the quantification of its main component

(evapotranspiration) are studied to determine the availability of water to rain fed crops and to calculate crop water requirements. Then it sets the limitations of crop production in relation to crop phenology, radiation interception and resource availability (e.g. nutrients). With that in mind the different agricultural techniques (sowing, tillage, irrigation, fertilization, harvest, application of

pesticides, etc.) are analyzed with special emphasis in quantifying the inputs (sowing rates, fertilizer amounts, irrigation schedules, tillage plans) required for a given target yield under specific environmental conditions (soil & climate). For all techniques strategies are provided for improving the ratio productivity/resource use while ensuring sustainability. The book comes with online practical focusing on the key aspects of management in a crop rotation (collecting weather data, calculating productivity, sowing rates,

irrigation programs,
fertilizers rates etc).

This book is concerned with the principles by which crop management can influence how plants use environmental resources. It synthesizes current knowledge in plant physiology, environmental physics, soil science and climate to provide a framework for studying crop production in tropical environments.
