Human Redux Book Intro **Redux
In Action**

Redux in Action is an accessible
guide to effectively managing
state in web applications. Built
around common use cases, this
practical book starts with a simple
task-management application
built in React. You'll use the app
to learn the Redux workflow,
handle asynchronous actions, and
get your hands on the Redux
developer tools.

Redux in Action is an accessible guide to effectively managing state in web applications. Built around common use cases, this practical book starts with a simple task-management application built in React. You'll use the app to learn the Redux workflow, handle asynchronous actions, and get your hands on the Redux developer tools.

Manning | Redux in Action
"Redux in Action" is a
comprehensive yet approachable
and practical how-to guide,
written by developers who have
solid experience with Redux. You
can't go wrong by adding this
book to your software-
development library. (However,
you should be "comfortable with
JavaScript (including ES2015) and
have at least basic proficiency
with React.")

Redux, Part I | New ...*
Introduction In Javascript, Redux
is used as state container for
many apps, mostly with React. It
relies on actions that get
dispatched and listened by
reducers, which update the state
accordingly. In this guide, we'll
look at different ways of
dispatching the action and at
isolating the components from
Redux.

*Different Ways to Dispatch
Actions with Redux | Pluralsight*
We can say that Redux reducers
reduce a set of actions (over
time) into a single state. The
difference is that with

Array.reduce() it happens all at once, and with Redux, it happens over the lifetime of your running app. Store# The current Redux application state lives in an object called the store.

Redux Fundamentals, Part 2: Concepts and Data Flow | Redux State, Actions, and Reducers are the building blocks of Redux. Every Redux app has state values, creates actions to describe what happened, and uses reducer functions to calculate new state values based on the previous state and an action. Here's the contents of our app so far: redux-fundamentals-example - CodeSandbox.

Redux Fundamentals, Part 3:

State, Actions, and Reducers ...
\$ yarn add redux-actions The npm package provides a CommonJS build for use in Node.js, and with bundlers like Webpack and Browserify. It also includes an ES modules build that works well with Rollup and Webpack2's tree-shaking. The UMD build exports a global called window.ReduxActions if you add it to your page via a <script> tag.

Read Me - redux-actions
Redux stores all the app state in one place which is a single source of truth called "store", in order to change the state, components can "dispatch" an action to change the store change, then the components that need to be aware of state changes can

"subscribe" to the store to get the state change, as shown:

Redux 101 - DEV
Redux is an implementation of the Flux pattern - An application architecture for building user interfaces which are created and used by Facebook. Redux is a library for managing the state of your application which is usually used with React, but it can also be used with other libraries and frameworks.

React, Axios and Redux: Asynchronously Fetch and Save Data ...
react-redux v5.1.1 This is used so we can access Redux's data and modify it by sending actions to Redux — actually not Redux, but

we'll get there The official docs state: It lets your React components read data from a Redux store, and dispatch actions to the store to update data

How to use Redux in ReactJS with real-life examples
Actions are the only source of information for the store as per Redux official documentation. It carries a payload of information from your application to store. As discussed earlier, actions are plain JavaScript object that must have a type attribute to indicate the type of action performed. It tells us what had happened.

Redux - Actions - Tutorialspoint
When an action is dispatched, the store receives it immediately.

These kinds of actions are straightforward, and synchronous code is generally easier to work with and think about. You know exactly the order things will execute based on where the code is defined.

Chapter 4. Consuming an API · Redux in Action
React Redux is maintained by the Redux team, and kept up-to-date with the latest APIs from Redux and React. Predictable. Designed to work with React's component model. You define how to extract the values your component needs from Redux, and your component receives them as props.

React Redux | React Redux
With our default state and

renderer in place we can start to use our libraries. redux and redux-actions can be found via the globals window.Redux and window.ReduxActions. Okay enough setup lets start to make something with redux! We are going to want a store for our defaultState. We can create one from redux using createStore.

Tutorial - redux-actions
Redux — Reducer — Handles an Action that's Dispatched and Alters the State. In the above, the Action ADD_TODO is called. Once it hits the reducer, the reducer determines that it matches with the case ADD_TODO and then proceeds to take the the value from action.toDo (which is a string) and adds it to the array

toDos:

How Does Redux Work?. I was recently given a scenario ...
The original Redux code for addTodo has an action object that looks like {type, id, text}. The FSA convention suggests that rather than having data fields with random names directly in the action object, you should always put your data inside a field named payload.
