In biology, a gene is a sequence of nucleotides in DNA or RNA that encodes the synthesis of a gene product, either RNA or protein.. During gene expression, the DNA is first copied into RNA. The RNA can be directly functional or be the intermediate template for a protein that performs a function. The transmission of genes to an organism's offspring is

Gene - Wikipedia

Reactive oxygen species (ROS) are highly reactive chemical molecules formed due to the electron acceptability of O<sub>2</sub>. Examples of ROS include peroxides, superoxide, hydroxyl radical, singlet oxygen, and alpha-oxygen.. The reduction of molecular oxygen (O<sub>2</sub>) produces superoxide (O<sub>2</sub><sup>-</sup>), which is the precursor of most other reactive oxygen species: O<sub>2</sub> + e<sup>-</sup> → O<sub>2</sub><sup>-</sup>

More than 30 cell lines derived from various species were screened but only a few cell lines were found to be susceptible, including Madin-Darby canine kidney type II (MDCK II) cells. The identification of cell lines susceptible to VSV chimeras allowed us to recover recombinant HL17NL10 and HL18NL11 viruses from synthetic DNA.
