"If you'd like a glimpse at how the next generation is going to program, this book is a good place to start." —Gregory V. Wilson, Dr. Dobbs Journal (October 2004) Build Your Own Automated Software Testing Tool Whatever its claims, commercially available testing software is not automatic. Configuring it to test your product is almost as time-consuming and error-prone as purely manual testing. There is an alternative that makes both engineering and economic sense: building your own, truly automatic tool. Inside, you'll learn a repeatable, step-by-step approach, suitable for virtually any development environment. Code-intensive examples support the book's instruction, which includes these key topics: Conducting active software testing without capture/ replay Generating a script to test all members of one class without reverse-engineering Using XML to store previously designed testing cases Automatically generating testing data Combining Reflection and CodeDom to write test scripts focused on high-risk areas Generating test scripts from external data sources Using real and complete objects for integration testing Modifying your tool to test third-party software components Testing your testing tool Effective Software Test Automation goes well beyond the building of your own testing tool: it also provides expert guidance on deploying it in ways that let you reap the greatest benefits: earlier detection of coding errors, a smoother, swifter development process, and final software that is as bug-free as possible. Written for programmers, testers, designers, and managers, it will improve the way your team works and the quality of its products.

Becoming an automated software testing expert first requires knowledge and understanding of an organizations development methodology, tools, schedules, and resources. Within this context, an overall strategy for implementing automated testing can unfold. Development of automated tests needs to be coordinated alongside other test activity and become part of the overall testing strategy. To successfully build and maintain a suite of automated tests requires the adoption of a process similar to application software development. In the world of automated tests, a framework describes those reusable components which form the basis of an automated testing program. An automated testing expert will assess the requirements of an organization, navigate the challenges posed by people and technology, and recommend, plan, implement, and maintain a process that maximizes the participation of all testers in creating automated scripts and analyzing run results. Expert automators should have broad knowledge of technical environments, hands-on experience with a variety of automated testing tools, and a technical background to ensure customization can be achieved.
