Waveguide Directional Couplers

A very commonly used basic element in microwave system is the directional coupler. Its basic function is to sample the forward and reverse

travelling waves through a transmission line or a waveguide. The common use of this element is to measure the power level of a transmitted or received signal.

Directional couplers can be realized in microstrip, stripline, coax and waveguide. They are used for

Sampling a signal, sometimes both the incident and reflected waves (this application is called a reflectometer, which is an important part of a network analyzer). Directional couplers generally use the distributed properties of microwave circuits.
